Hackathon Discovery Platform

- Solving the Problem of Finding Relevant Hackathons

- Presented by:

Akshata Mankani

Dhruthi K M

Introduction

- Hackathons help students showcase skills and gain real-world experience
- They encourage collaboration and peer learning
- Finding relevant hackathons is a major challenge
- Information is scattered across websites, social media, and communities
- Difficult to track and evaluate suitable opportunities

Problem Statement

- Students struggle to find relevant hackathons.
- Information is scattered.
- No centralized platform.
- Difficult domain filtering.
- Missed opportunities.

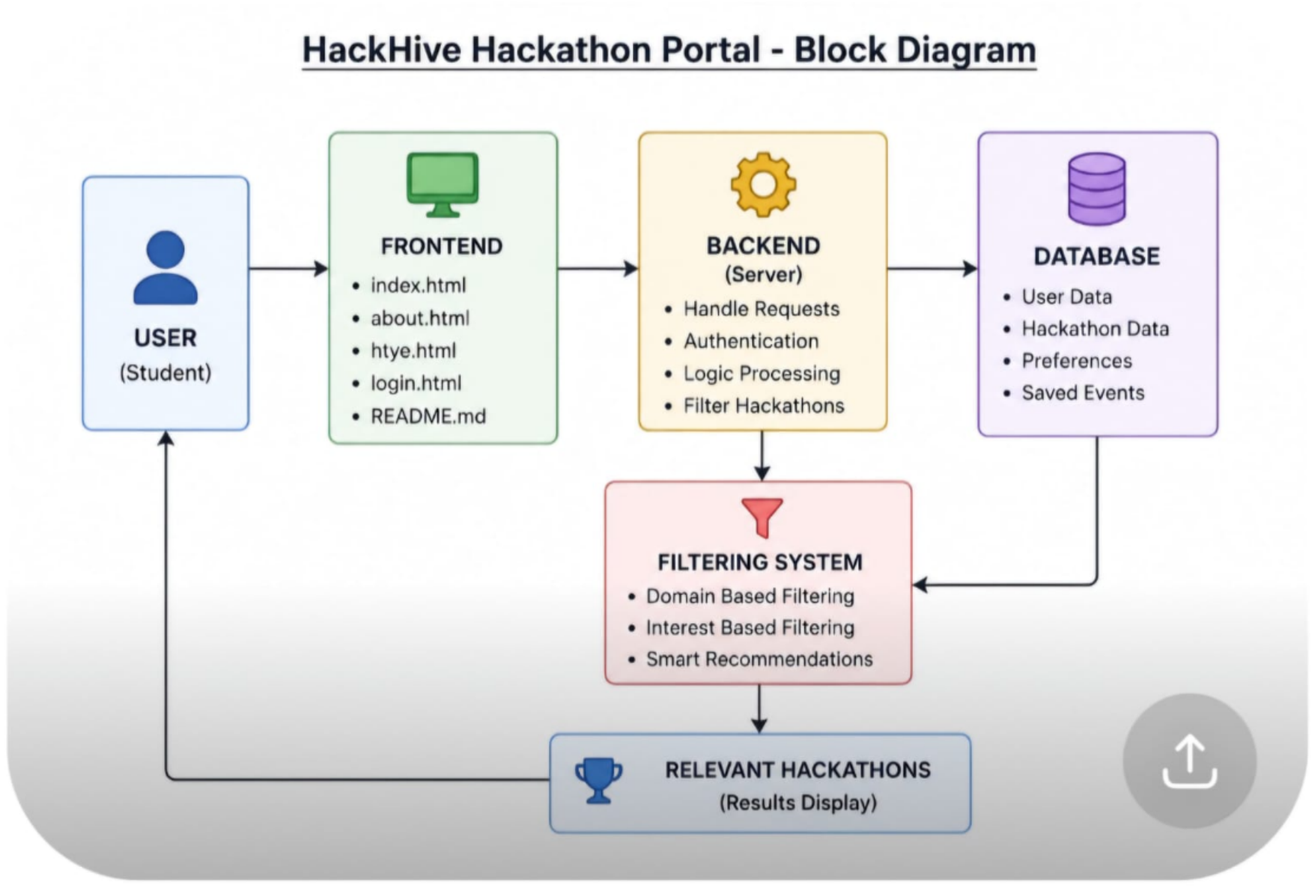
Impact of the Problem

- Miss learning & networking opportunities
- Reduced participation
- Time wasted searching
- Less exposure to real challenges

Proposed Solution

- Centralized hackathon platform
- Domain-based filtering (AI, Web, IoT)
- Search by location & date
- Personalized recommendations
- Notifications

Block diagram



Methodology

- User (student) interacts with the platform
- Frontend provides the user interface (pages like home, login, about)
- User inputs (search, preferences) are sent to the backend
- Backend handles requests, authentication, and processing
- Database stores user data, hackathon details, and preferences
- Filtering system applies domain-based and interest-based filtering
- Smart recommendations are generated
- Relevant hackathons are displayed to the user
- Continuous flow: User → Frontend → Backend → Database → Filtering → Results

Key Features

- User-friendly interface
- Smart filtering
- User profiles
- Bookmark hackathons
- Community integration

Conclusion

- Simplifies discovery
- Saves time
- Increases participation
- Encourages innovation
